

One question, in the room it is about

“Is the small grey wastepaper basket near the long narrow desk?” — a real handheld capture, the two delivered regions, and the stored relation between them.

THE CAPTURE — BOTH REFERENTS VISIBLE

THE TWO REFERENTS, AS DELIVERED

obj_1 — the basket.
Bridge resolved it: **correct**.
obj_14 — the desk.
Bridge **abstained**: no entity won two view slots.

Stored edge obj_1 ↔ obj_14: surface distance **0.0 m** < 1.0 m, so **NEAR holds**. The answer is in the store.

stored relations, human identity	correct	
NOT DEPLOYABLE		
delivered graph, learned labels	could not answer	no delivered instance carries an admitted label for this object
grounded graph, CLIP bridge	could not answer	the grounding bridge abstained on this anchor
direct multiview RGB	correct	

The relation is present and correct. Human identity reaches it; the delivered labels never address it; the bridge binds one referent of two and abstains on the other, so the edge is unreachable through it. Crops and frames are from the committed review sheet; outcomes from the packed relation report.
